

# PROJECT TITLE: ENLACEMENT

## Team Members:

- Aarushi Mishra (200352)
- Ananya (200354)
- Madhavi Sen (200371)
- Pragya Sharma (200376)

**ABSTRACT:** The Project entitled “ENLACEMENT” is an online placement cell on which companies provide details of job vacancies in their company which is further visible to college students and then the students can apply in any job as per the eligibility criteria and their wish.

This project will be done using JAVA SWING as the front end, and MySQL as the backend.

This project is mainly useful to college students as while using this platform the students don't need to search for jobs on multiple websites. They can get all the info on one single platform.

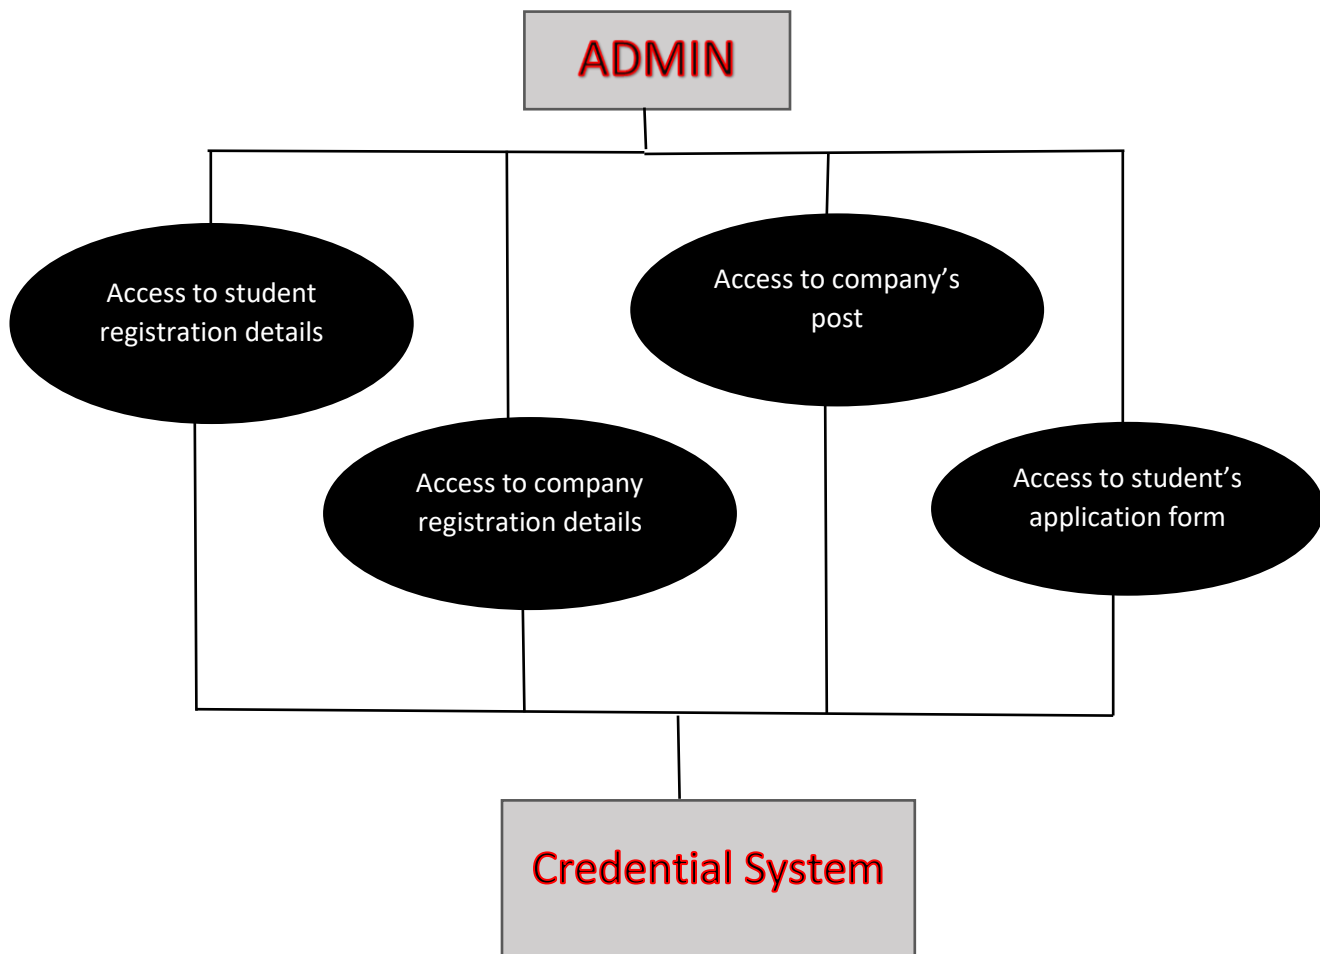

**OBJECTIVE:** The main motive behind creating this project of ONLINE PLACEMENT CELL is to make connections between college students and companies, that further leads to enhanced Job Information discovery and delivery. On this platform, whatever the information Training and Placement Office (TPO) has to pass to the students, that can be informed directly to the students by the companies.

It reduces the paper work and storage area. Saves time and work load for TPO staff. Avoid fake entry. Easy to access. Improve accuracy in results.

**INTRODUCTION:** Enlacement means to entwine or enlase something together. Giving justice to its name, our java programs main motive is to enlase college students to their dream job. Enlacement is a college placement portal that allows companies to post their job application and internship post that can directly be viewed by the students. Students and companies can only access the portal

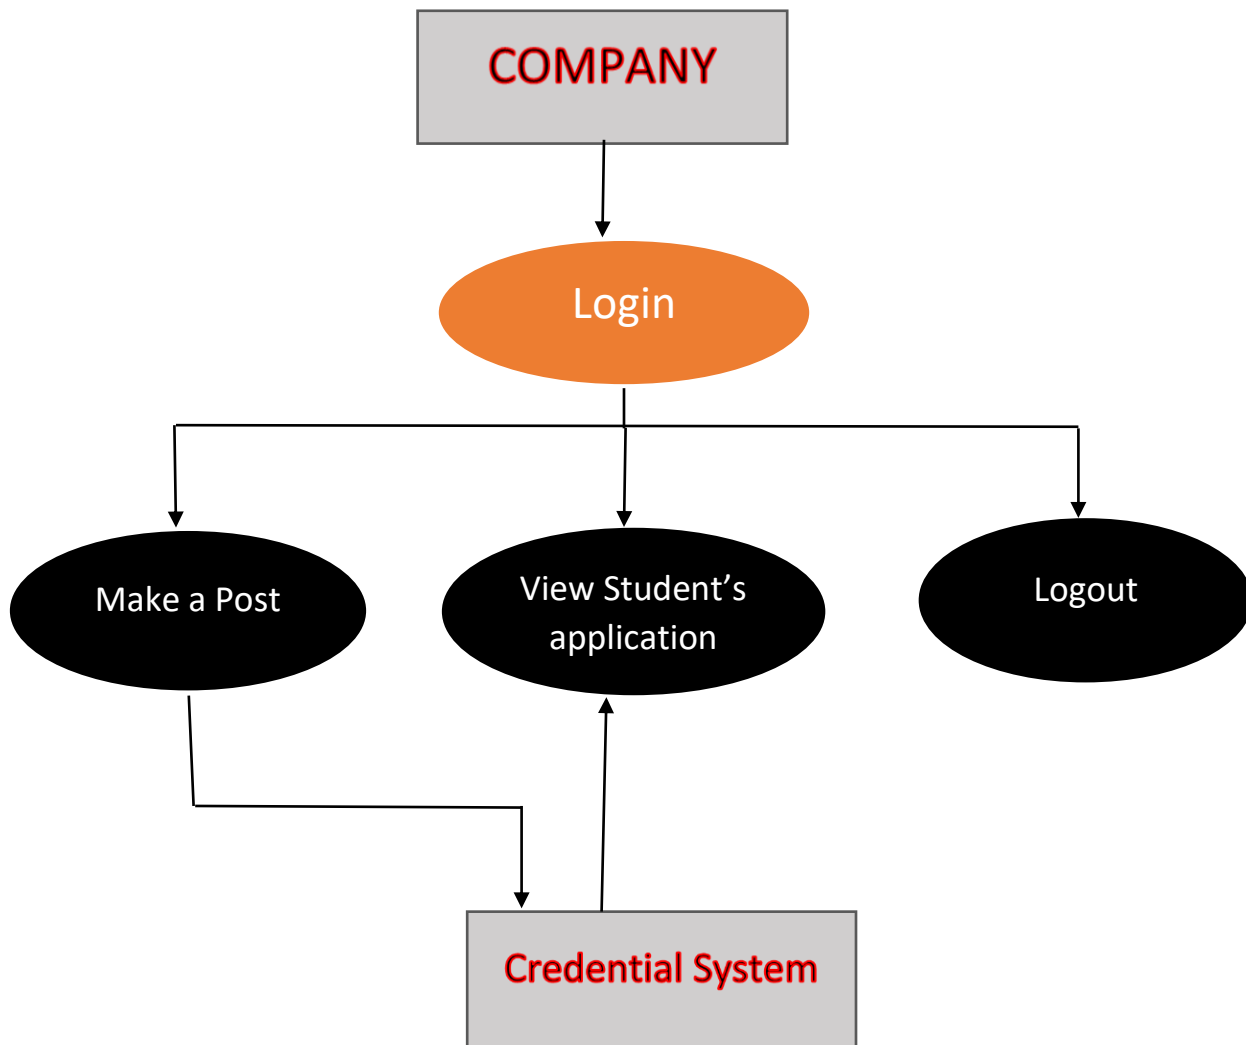

through a special username and password which they generate through registration on this platform.

- **ADMIN:** The admin, which is a college in this project, has access to the database in which complete details of company registration, company's job post, student registration, student application form details is stored.

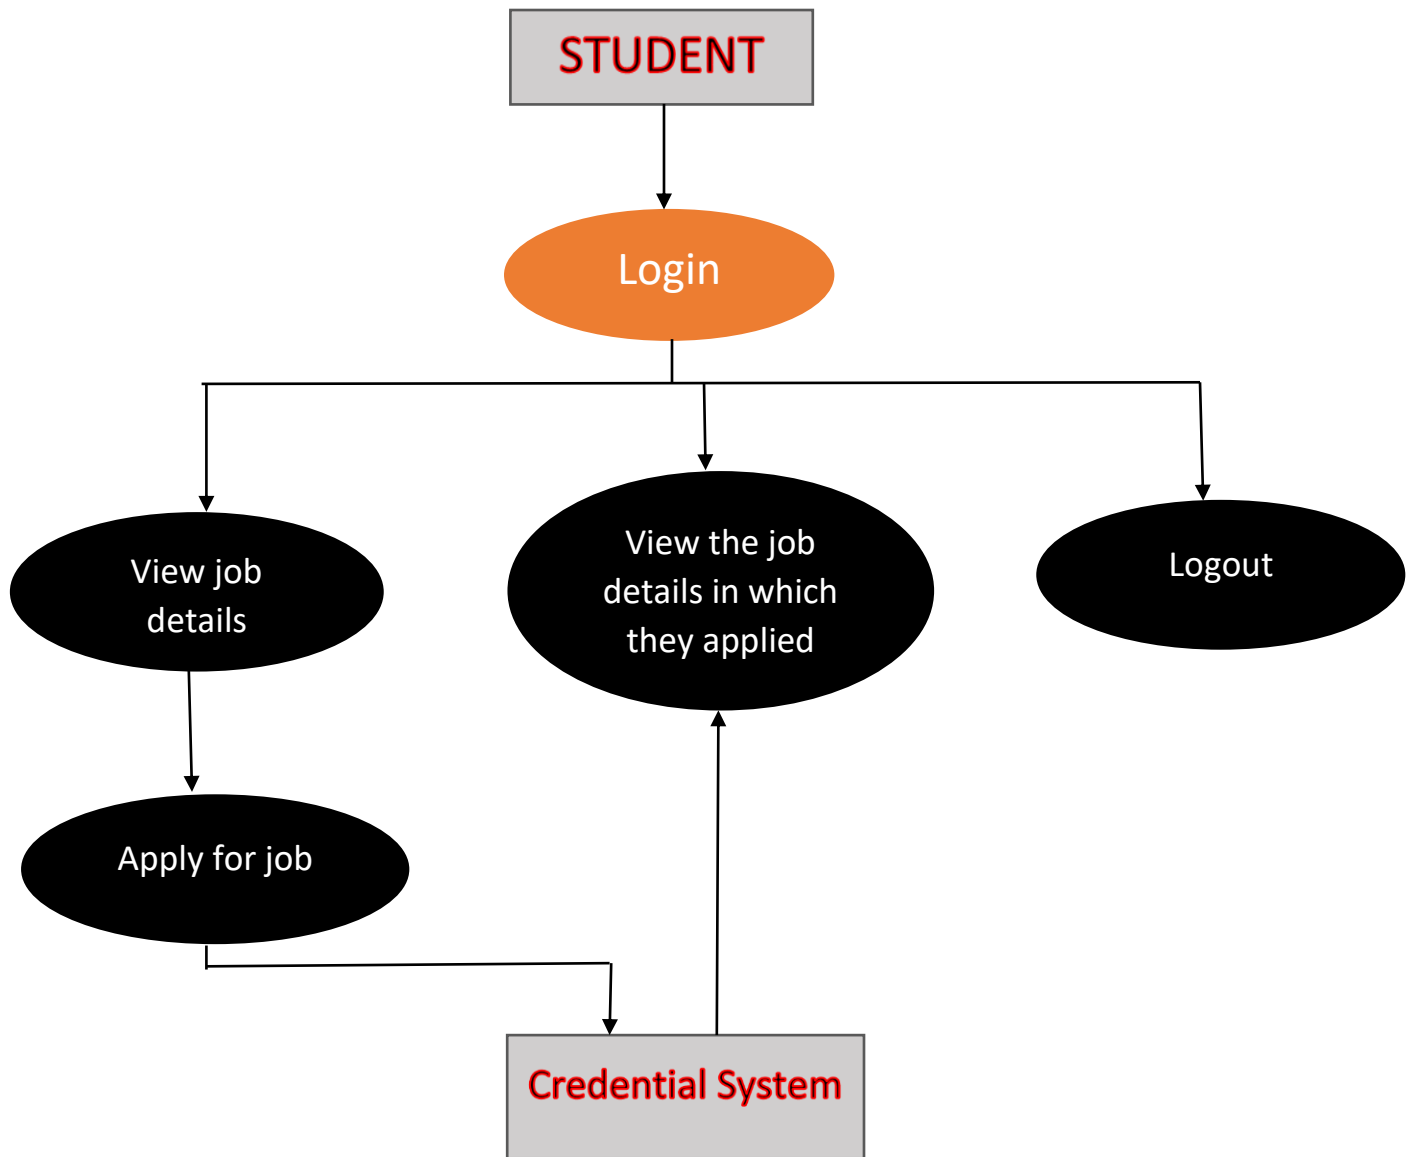

- **COMPANY:** Companies can login through their username and password after registration is done successfully. The Company Dashboard page will be visible to them after login. Then they can post job application details and will assign a unique job code to every post. The application form details of the students who will apply in their company will be visible to them. Companies can then shortlist the students as per their requirements. They

can then notify the students about the interviews or can communicate with students directly.

- **STUDENT:** Students can access the portal through their username and password after the registration is done successfully. The Student Dashboard page will be now visible to them. Students can go through all the job details and eligibility criteria. They can now apply in any job by filling their details and the unique job code, provided in every job post, in the application form visible to them. They can directly connect with the companies for any queries. If selected they will be contacted by the company. They are also

provided with an option in which they can view the details of all the companies in which they have applied whenever they want.

## **TOOLS & PLATFORM TO BE USED:**

### **Hardware Requirements:**

Processor: Pentium 4 or above

RAM: 512 MB or above

Hard Disk: 40 GB or above

### **Software Requirements:**

Operating System: Windows XP or above

Platform: Eclipse IDE

Back End: DB2(IBM Database)

### **Technologies Used:**

We have used Java, Java SWING for Desktop Application and DB2 for the database.

## **JAVA**

Java is a high-level programming language originally developed by Sun Micro System and released in 1995. Java runs on a variety of platforms, such as Windows, macOS, and the various versions of UNIX. Java is one of the world's most important and widely used computer languages, and it has had this distinction for many years. Unlike some other computer languages whose influence has varied with time, Java's has grown. Till today it is the first and best choice for developing console/web-based applications.

### **Creation of Java**

Java was developed by James Gosling, Patrick Naughton, Mike Sheridan at Sun Microsystems Inc. in 1991. It took 18 months to develop the first working version. The initial name was Oak but was renamed Java in 1995. James Gosling initiated the Java language project in June 1992 for use in one of his many set-top box projects. The language, initially called Oak after an oak tree that stood outside goslings office, also went by the name Green and ended up later being renamed as Java from a list of random words. Sun released the first public implementation as Java 1.0 in 1995. It promised Write Once, Run Anywhere (WORA), providing no-cost runtimes on popular platforms.

## Application of Java

Java is widely used in every corner of the world and of human life. Java is not used in software but is also used in designing hardware controlling software components. There are more than 930 million JRE downloads every year and 3 billion phones run Java. Following are a few applications of Java: ● Developing desktop application

- Web applications like LinkedIn
- Mobile OS like android
- Embedded system
- Robotics and games etc.

## Features of Java

The prime reason behind the creation of Java was to bring portability and security features into a computer language. Besides these two major reasons, many other features played an important role in molding out the final form of this outstanding language. Those features are:

**Simple:** Java is easy to learn and its syntax is quite simple, clean, and easy to understand. The confusing and ambiguous concepts of C++ are either left out in Java or have been re-implemented more cleanly.

Example: pointers and operators overloading or not there in Java but you are an important part of C++.

**Object-oriented:** In Java, everything is an Object which has some data and behavior. Java can be easily extended as it is based on Object Model.

**Robust:** Java makes an effort to eliminate errors prone codes by emphasizing mainly compile-time error checking and runtime checking. But the main areas which Java improved were Memory Management and mishandled Exceptions by introducing automatic Garbage Collector and Exception and Exception Handling.

**Platform Independent:** Unlike other programming languages such as C, C++ etc. which are compiled into platform-specific machines. Java is guaranteed to be write-once, run anywhere language. On compilation, Java programs are compiled into bytecode. This bytecode is platform-independent and can be run on any machine, plus this bite code format also provides security. Any machine with Java Runtime Environment can run Java programs.

**Secure:** When it comes to security, Java is always the first choice. With Java secure features it enabled us to develop virus-free, temporary systems. Java

programs always run in a Java runtime environment with almost null interaction with system OS, hence it is more secure.

**Multi-Threading:** Java multithreading features make it possible to write a program that can do many tasks simultaneously. The benefit of multithreading is that it utilizes the same memory and other resources to execute threads at the same time, like while typing, grammatical errors are checked along.

**JVM:** stands for Java Virtual Machine that provides a runtime environment to execute Java bytecode. JVMs are most often implemented to run on existing operating systems. JVM controls the execution of every Java program. It enables features such as automated exception handling, garbage-collected heap.

## **JAVA SWING**

Swing is a GUI widget toolkit for Java. It is part of Oracle's Java Foundation Classes (JFC) - API for providing a graphical user interface (GUI) for Java programs. Swing was developed to provide a more sophisticated set of GUI components than the earlier Abstract Window Toolkit (AWT). Swing provides a native look and feel that emulates the look and feel of several platforms, and also supports a pluggable look and feel that allows applications to have a look and feel unrelated to the underlying platform. It has more powerful and flexible components and AWT. In addition to familiar components such as buttons, checkboxes and labels, Swing provides several advanced components such as tabbed panels, scroll panes, trees, tables, and lists. Unlike AWT components, Swing components are not implemented by platform-specific code. Instead, they are written entirely in Java and therefore are platform-independent. The term "lightweight" is used to describe such an element. Though swing is intended to be replaced by Java FX, it will remain part of the Java SE specifications for the foreseeable future. Swing is a platform-independent, "model-view-controller" GUI framework for Java which allows a single-threaded programming model.

Additionally, this framework provides a layer of attraction between the code structure and graphic presentation of Swing-based GUI.

### **Foundations**

Swing is platform-independent because it is completely written in Java. Complete documentation for all Swing classes can be found in Java API Guide for Version 6 or the Java Platform Standard Edition 8 API specifications for Version 8.

### **Extensible**

Swing is a highly modular-based architecture, which allows for the “plugging” of various custom implementations of specified framework interfaces. Users can provide their custom implementation(s) of these components to override the default implementation using Java ‘s inheritance mechanism. Swing is a component-based framework, whose components are all ultimately derived from the javax.swing.JComponent class. Swing objects asynchronously fire events, have bound properties, and respond to a documented set of methods specific to the component. Swing components are JavaBeans components, compliant with the JavaBeans component architecture specifications.

### **Configurable**

Swing's heavy reliance on runtime mechanisms and indirect composition patterns allows it to respond at runtime to fundamental changes in its settings. For example, a Swing-based application is capable of hot-swapping its user interface during runtime. Furthermore, users can provide their look and feel implementation, which allows for uniform changes in the look and feel of existing Swing applications without any programmatic change to the application code.

### **Lightweight UI**

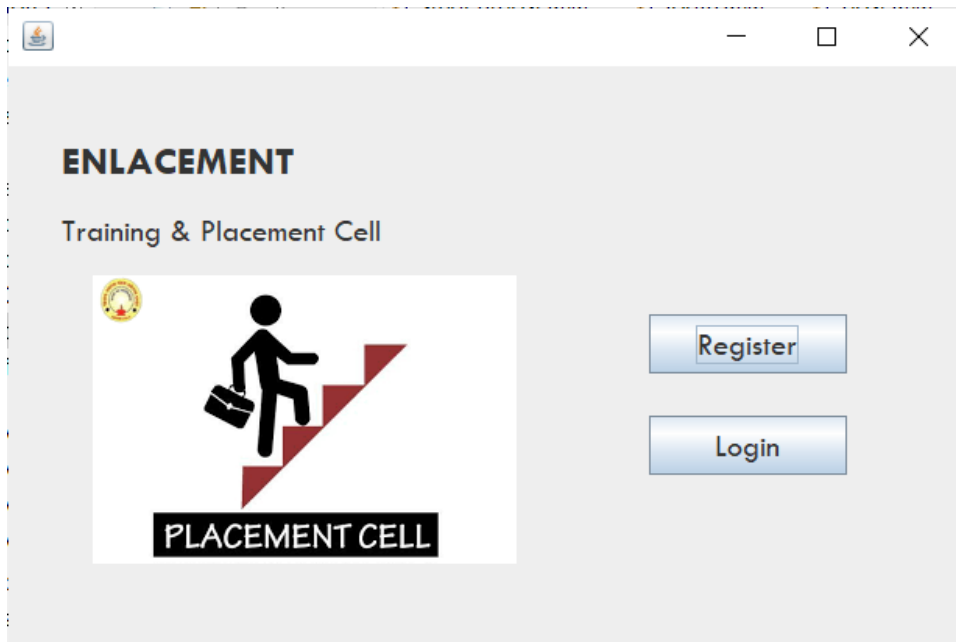

Swing's high level of flexibility is reflected in its inherent ability to override the native host property system (OS)’s GUI controls for displaying itself.

**About Database – DB2:** A relational database allows for a declarative model of the data and access to it via queries. For that purpose, IBM invented the now de-facto standard SQL (Structured Query Language). SQL is a very simple, English-like language which facilitates table creation, accessing and manipulation of the data contained herein. Multiple entries in the tables (called “records”) can be inserted, deleted and updated at the same time by concurrent users using commands specified in SQL. In the 1990s, a version of DB2 called LUV (Linux, UNIX, Windows) was introduced marking the porting of the database to smaller-type computing platforms. The range of computing platforms that DB2 runs on is wide, from mainframes and large distributed platforms to smaller-scale PCs. DB2 Express-C, a free-of-charge version similar to the open-source MySQL, albeit not open source, is offered to the developer community. DB2 can be administered either through a command-line prompt or a GUI. The highly advanced features and security of DB2 make it a widely used database in the modern software industry.

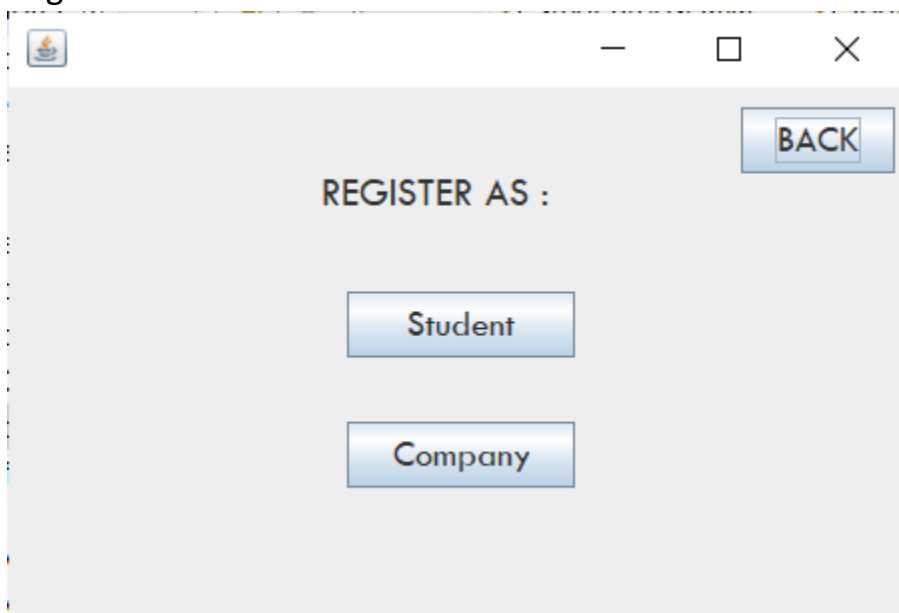

### **SCREENSHOTS:**

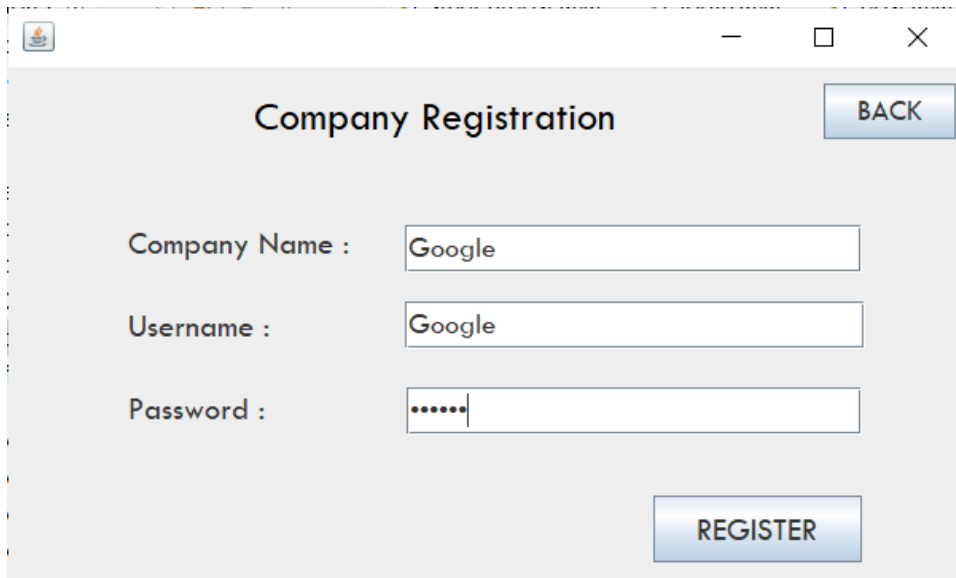

Dashboard:

Register As:

Company Register:

A screenshot of a web application window titled "Company Registration". The window has a standard Windows-style title bar with a minimize button, a maximize button, and a close button. The form is set against a light gray background. It features three input fields: "Company Name" with the value "Google", "Username" with the value "Google", and "Password" with masked characters ".....". A "BACK" button is located in the top right corner, and a "REGISTER" button is at the bottom right.

Company Dashboard:

A screenshot of a web application window titled "COMPANY DASHBOARD". The window has a standard Windows-style title bar with a minimize button, a maximize button, and a close button. The main content area is light gray and contains three blue buttons with white text, stacked vertically in the center: "Make A Post", "View Student Application", and "LOGOUT".

Make a Post:

A screenshot of a web application window titled "WELCOME...". The window has a standard Windows-style title bar. The main content area is light gray and contains a "BACK" button in the top right corner. Below the title bar, the text "Provide the following job details to make a post :" is displayed. The form consists of several fields with labels on the left and input areas on the right:

- Username :** Input field containing "Google".
- Emailid :** Input field containing "google123@gmail.com".
- Position :** Input field containing "Software Developer".
- No. of Vaccancies :** Input field containing "5".
- Job Description :** Text area containing "Evaluating system performance, designing and implementing new programs and features".
- Required Skills :** Text area containing "Data structures and algorithms", "Java script and HTML/CSS", "Networking Basics", and "Basics of testing".
- Minimum Package :** Input field containing "18" followed by "LPA".
- Last Date to Apply :** Input field containing "22-08-2021".
- Job Code :** Input field containing "G0987".

A "POST" button is located in the bottom right corner of the form area.
